

# COMP 1600 Fall 2025

## Lab 1: Name, Rank, and Serial Number

### Due by the end of class

Today's task is to implement a simple program that prints out some basic information about yourself.

Don't be afraid to ask for help. The main purpose of this lab is to make sure that you know how to use IntelliJ and can write a basic working program in Java.

### Specification

Create a project called `Lab1`, saved into your OneDrive folder. You will probably need to connect to OneDrive before you can do so. Add a Java class to the project called `Name`. Then, write a Java program, using the Hello World example covered in class as a model, printing out your name, your major, and your favorite hobby.

Here is sample output for me, but of course, your own information should be specific to you. Disk golf is a sport similar to golf, but played with plastic disks (think Frisbee™) instead of golf balls and baskets with chains instead of holes. IntelliJ will print out this information in the Run pane toward the bottom of your window. Try to get the spacing to match my sample exactly, making it so that your name, major, and favorite hobby are all aligned on the left.

```
Name:  David Stucki  
Major: Computer Science  
Hobby:  Disk golf
```

### Turn In

Find the file `Name.java` in the `Lab1\src` folder wherever you created your project, ideally in your Otterbein University OneDrive folder. Upload `Name.java` to [Brightspace](#). Especially this first time, check with me to make sure you saved it properly. **Do not** upload the entire project. I only want the `Name.java` file.

All work must be done individually. Never look at someone else's code. Please refer to the course policies if you have any questions about academic integrity. If you have trouble with the assignment, I am always available for assistance.
